Cloud Security Threats
Every Business Should Know

Your business might be thriving in the cloud, but is it really secure? Let's explore the common threats that business owners like you need to know about.

Data breaches

If your cloud isn't secure, hackers can steal your valuable data, leading to both financial and reputational loss.

Account hijacking

Cybercriminals can take control of your accounts by tricking users through phishing emails or exploiting weak passwords.

Misconfigured settings

Small mistakes like leaving cloud storage open to the public or not enabling security features can leave you vulnerable.

Insider threats

Employees or vendors can accidentally—or intentionally—share sensitive iles or misuse access, putting your business at risk.
